Chapter 1:- Introduction

1.1 ABSTRACT

The project aims at developing a marksheet generation system which can be used in universities to automate the distribution of digitally verifiable student result mark sheets. This system is mainly based in the database technology. The system is targeted to small enterprises, schools, colleges and universities. It can produce sophisticated ready-touse mark sheet, which could be created and will be ready to print. The development of a marksheet and gadget sheet is focusing at describing tables with columns/rows and subcolumn sub-rows, rules of data selection and summarizing for report, particular table or column/row, and formatting the report in destination document. Marksheet generation system can be used in universities to automate the distribution of digitally verifiable mark-sheets of students. The system accesses the students' exam information from the university database and generates the gadget-sheet Gadget sheet keeps the track of student information in properly listed manner. The project aims at developing a marksheet generation system which can be used in universities to automate the distribution of digitally verifiable student result mark sheets. The system accesses the students' results information from the institute student database and generates the mark sheets in Portable Document Format which is tamper proof which provides the authenticity of the document. Authenticity of the document can also be verified easily.

1.2 RATIONALE

The marksheet generator is a system which allows the digital automation of the mark-sheets of the students. The system will generate the mark-sheets in Portable Document Format which is globally accepted format for files. To simply put, system is to provide the mark-sheet for credits based grading system in user friendly and secure manner. The credits based grading system enables a much require shift in focus from teacher-centric to learner-centric education. It also focuses on the continuous evaluation which will enhance the quality of education. It is very much essential to implement credits based grading system based higher education worldwide. The efficiency of the system would increase in a leap and bounds considering the fact that system will be automated & would be corruption free. Along with the above mentioned privileges, it also ensures security & spreads the awareness about the university rules and regulation.

1.3 COURSE OUTCOMES ADDRESSED

i. Develop a program using Applet in java.

ii. Implementation of ActionListener .

iii.Use of html code

Chapter 2:-Literature Review

In this proposed system, the admin of the system enters the marks of each student. That information will be stored in internal collection information database. In this system, percentage and grade is calculated manually. The marksheet generation system is to ensure an efficient marksheet management using huge data and to provide mark-sheets for credit based grading system in very user friendly manner by not making it very complex. As we describe in the existing system after the paper is check the marks goes to the mark sheet generator system. The admin of the system in this proposed system just enter the mark and information of the each student. That information will be stored in internal collection information database. In the system the percentage and grade is calculated manually. After the marks of all the students is enter by the admin of the system by clicking the mark sheet generator button. Then application generates the mark sheet of all the students automatically with the grades calculated. Mark sheets will be in PDF format.PDF mark sheets cannot be easily tampered with and require use of complex software. The pdf file of mark sheet of every student will be stored in mark sheet database. And then application makes mark sheets available via internet on demand.

Chapter 3:- Project Details

3.1 Source Code :-

```
Import java.applet.Applet;
import java.awt.*;
import java.awt.event.*;

 public class Marksheet extends Applet implements ActionListener
{
Choice m;
Label a,b,c;
TextField t1,t3,t4,t5,t6,t7,t8,t9,t11,t12;
Button b1,b2; Font f;

 public void paint(Graphics g)
{
g.drawString("Total:-",100,540);
g.drawString("Percentage:-",100,590);
 drawString("100",670,270);
g.drawString("100",670,310);
g.drawString("100",670,350);
g.drawString("100",670,390);
 g.drawString("100",670,430);
 g.drawString("RollNo",50,130);
 g.drawString("Branch",420,130);
 g.drawString("Name",50,170);
g.drawString("Year",420,170);
}
g.drawString("Sr.No",40,230);
 g.drawString("Name of Sub",190,230);
g.drawString("Mark Obtain",450,230);
```

```
g.drawString(“Total Mark”,670,230);
g.drawString("1",40,275);
g.drawString("2",40,315);
 g.drawString("3",40,355);
 g.drawString("4",40,395);
 g.drawString("5",40,435);
 g.drawString("JAVA",190,275);
 g.drawString("MIII",190,315);
g.drawString("DM",190,355);
 g.drawString("DS",190,395);
 g.drawString("AEDLD",190,435);
 g.drawRoundRect(10,10,820,600,30,30);
 setBackground(Color.pink);
 g.drawRect(20,200,800,300);
 g.drawLine(110,200,110,500);
 g.drawLine(350,200,350,500);
g.drawLine(600,200,600,500);
 g.drawLine(20,250,820,250);
}

 public void init()
{
 setLayout(null);
b=new Label(“Result”);
m=new Choice();
 m.add(“COMP”);
m.add(“EXTC”);
m.add(“Electrical”);
m.add(“CIVIL”);
m.add(“MECH”);

t4.setText("");
 t5.setText("");
t6.setText("");
t7.setText("");
 t8.setText("");
t9.setText("");
 t11.setText("");
 t12.setText("");
 }
}
 }

<html>
<body>
/* <applet code="Marksheet.class" width="840" height="630">
 </applet> */
</body>
```

```
</html>
```

Compilation: javac Marksheet.java

Execution: appletviewer Marksheet.htm

Chapter 5:- Application

5.1 APPLICATIONS

Marksheet is authorized certificate which is consisting of his/her marks for showing progress in respective semester. In our project, mark sheet can be extracted in a PDF which is exclusive feature of our project as shown in Figure 4. The system automated and generalized the system ensures to reduce manual error by reducing manual efforts.

An added asset to the feature of the system is that aims at improving and easing out the work of existing system in very sophisticated way. Also, this system is faster than the earlier methods of manually feeding, calculating and cross-checking the marks. As this is a web-based system, it can provide services over the Internet on an On-Demand basis, thus making it more accessible. In future the system has sufficient adaptability to couple itself with the already existing mark sheet generation system systems. Also, there will be scope for integrating the report generation technology with this system. The software is flexible enough to be modified and implemented as per future requirements. The system can be made more secure by providing various security features at different levels. It can also be applied at University level to store results of thousands of students without any glitches and is reliable.

Chapter 6:- Conclusion

6.1 CONCLUSION

We have automated the examination system for generating the gadget sheet and marksheet of the students. In project phase I of semester VII, we have stated that the project facilitates the provision of safe, authenticated and web based system and also automated marksheet generating for grading system and storage and will directly provide the result in form of PDF.
